

Module 27-Bank Calculation Using Function (advanced)

27-1 Module overview and project setup

27-2 Get User deposit and set deposit total value

27-3 Update deposit and balance and handle string add

27-4 Money withdraw and reduce balance for withdraw

27-5 (advanced) Common function to reduce code repeat

```
function doubleIt(num) {  
  const result = num * 2;  
  return result;  
}  
  
const fiveDouble = doubleIt(5);  
const severDouble = doubleIt(7);  
  
function getInputValue() {  
  const depositInput = document.getElementById("deposit-input");  
  const newDepositAmountText = depositInput.value;  
  const newDepositAmount = parseFloat(newDepositAmountText);  
  
  depositInput.value = "";  
  
  return newDepositAmount;  
}
```

27-6 (advanced) Share one function between two input field

```
function getInputValue(inputId) {  
  const inputField = document.getElementById(inputId);  
  const inputAmountText = inputField.value;  
  const amountValue = parseFloat(inputAmountText);  
  
  // clear input field  
  inputField.value = "";  
  return amountValue;  
}
```

27-7 (advanced) Deposit and withdraw update with one function

```
function updateTotalField(totalFieldId, amount) {  
  // debugger;  
  const totalElement = document.getElementById(totalFieldId);  
  const totalText = totalElement.innerText;  
  const previousTotal = parseFloat(totalText);  
  
  totalElement.innerText = previousTotal + amount;  
}
```

27-8 (advanced) Shared Balance update function

```
function updateBalance(newDepositAmount, isAdd) {  
  const balanceTotal = document.getElementById("balance-total");  
  const balanceTotalText = balanceTotal.innerText;  
  const previousBalanceTotal = parseFloat(balanceTotalText);  
  
  if ((isAdd == true))  
  {  
    if (newDepositAmount > 0) {  
      const newBalanceTotal = previousBalanceTotal + newDepositAmount;  
      balanceTotal.innerText = newBalanceTotal;  
    }  
    else  
    {  
      console.log("Not enough taka");  
    }  
  }  
  else  
  {  
    if (previousBalanceTotal >= newDepositAmount && newDepositAmount >  
0) {  
      const newBalanceTotal = previousBalanceTotal - newDepositAmount;  
      balanceTotal.innerText = newBalanceTotal;  
    } else {  
      console.log("Not enough balnace");  
    }  
  }  
}
```

27-9 (advanced) Nested function and error handling
